

SYSTEM IMPLEMENTATION

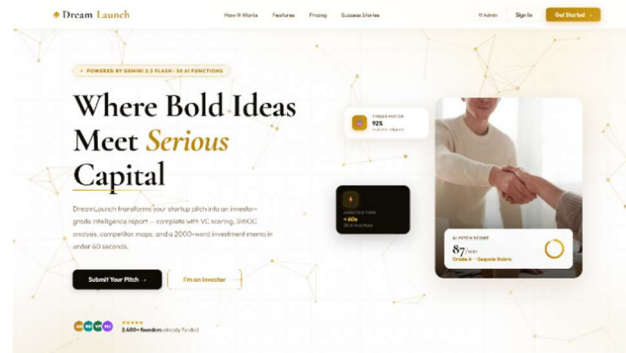

Fig 5.1

Figure 5.1 DreamLaunch Platform Landing Interface

DreamLaunch platform has its landing interface where both the innovators and investor are allowed in. The interface forms the essence of the system purpose, i.e., the transformation of the entrepreneurial ideas into investor-grade analytical reports using artificial intelligence. The platform highlights the stacking of various AI analytical applications that evaluate startup plans through automated scoring, strategic analysis and investment insights. The user can be able to enter the system with either a startup pitch or through the investor exploration interface. Such a design provides a brief summary of the objective of the platform and successfully promotes the interaction of users in the sphere of the startup-investment.

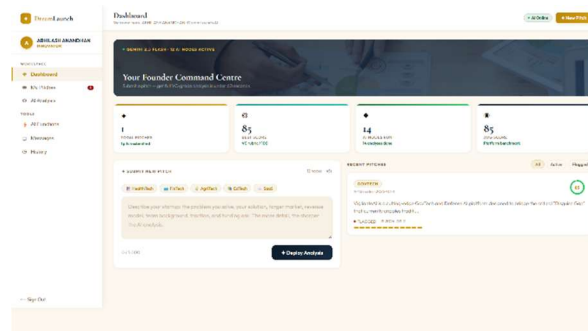

Fig 5.2

Figure 5.2 Innovator Dashboard Interface

The founder dashboard serves as the main working platform of founders interacting with the DreamLaunch platform. It provides an organized space where the users may handle the startup submissions, trace the results of the analysis, and trace the evaluation metrics produced by the engine of AI. The dashboard shows important information like the number of submitted pitches, artificial intelligence processing of the pitches and total score performance. Moreover, the interface allows the innovators to start new submissions of pitches and re-examine the proposals that have already been analyzed. The module will help founders to communicate effectively with the AI-based evaluation system and optimize their startup ideas in accordance with the insights generated.

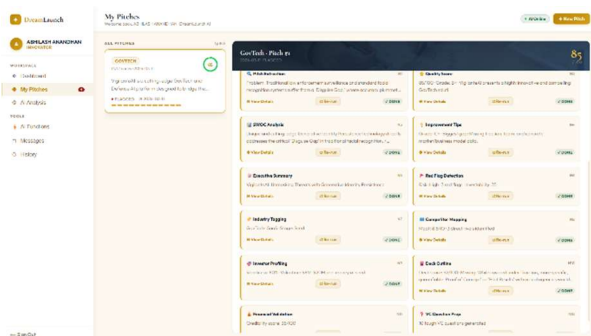

Fig 5.3

Figure 5.3 AI Startup Analysis Module

The module of the analysis of AI startups shows the analytical result that was received after a pitch. The system has automated operations to extract and analyze various aspects of the startup proposal such as pitch extraction, quality scoring, strategic SWOC, competitor mapping, financial validation, and investment readiness profiling. Other elements of the analysis, including recommendations about red flags and recommendations on improving the proposal, help founders understand possible shortcomings of their proposal. The multi-stage assessment pipeline modeled by the Analysis interface is manifested in the modular design of the analysis interface that can be found in the DreamLaunch platform.

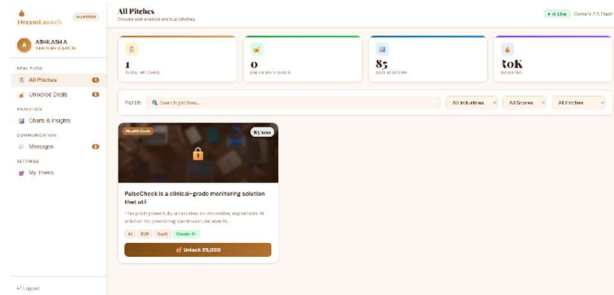

Fig 5.4

Figure 5.4 Investor Discovery Interface

The investor discovery interface allows the investors to explore startups that the platform has to offer. Pitches that are submitted are sorted and presented in a format that contains the necessary information like industry classification, AI assessment score, and investment grade. The investor can window shop through startup proposals using filtering and search features to locate ventures that match his/her interests in investing. Some of these advanced analytical tools are also secured using the controlled access tools so that investors can gain higher levels of access to investment reports through the integrated access system within the platform.

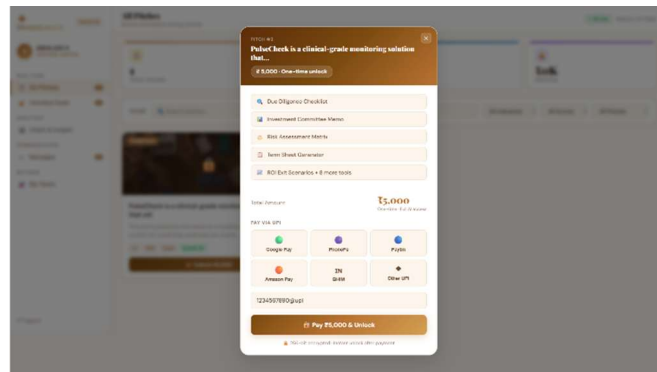

Fig 5.5

Figure 5.5 Investor Due Diligence and Unlock System

Investors are able to open up in-depth analytical applications, including investment committee memos, risk assessment matrices, due diligence checklists, and term sheet generators. The system will also use the safe payment systems to enable investors to obtain high-quality analytical reports. This module will make sure that the in-depth investment information is secured and will be available to the investors with a full range of assessment tools necessary to make informed decisions.

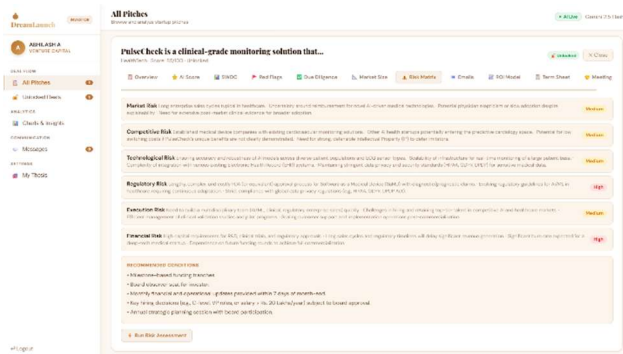

Fig 5.6

Figure 5.6 Risk Assessment and Analytical Insights

This interface displays the risk analysis that has been produced on a given startup proposal. The platform classifies various risk factors, such as market risk, competitive risk, technological risk, regulatory risk, and execution risk, and financial risk. The categories are evaluated and given the level of severity according to the AI assessment model. The findings are useful to investors in the knowledge of the possible challenges of investment and strategies to be taken before putting money into place.

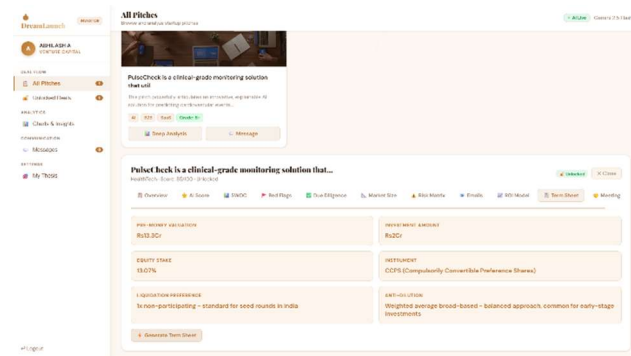

Fig 5.7

Figure 5.7 Investment Term Sheet Generation

The sheet generation module shows the automated financial modeling feature that is incorporated in the DreamLaunch system. Depending on the analysis of the start-up and financial contribution, the platform will create investment terms including pre-money valuation, investment size offered, equity participation, liquidation preference, and anti-dilution. This feature assists investors in the initial stages of the negotiation process and allows to simplify the organization of preliminary investment.

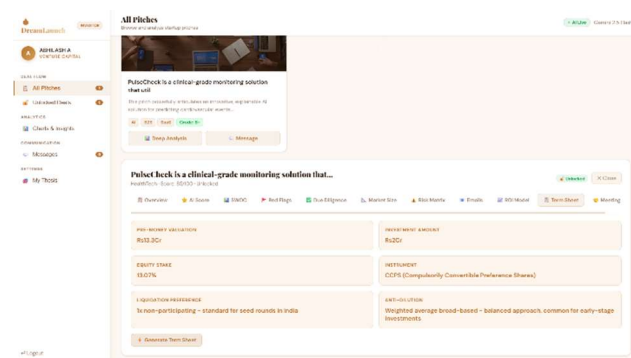

Fig 5.8

Figure 5.8 Administrative Governance Dashboard

The administrative control interface allows the administrators of the platform to control and monitor the work in the system. The dashboard provides an insight on the metrics of the platform such as the number of users, the number of pitches, the revenue generated, and the average score of the startup evaluation. Administrators are also able to check frauds, moderate pits submitted and control platform analytics. This governance level helps in protecting the integrity, reliability, and the correct functionality of the DreamLaunch ecosystem.
